Thema der Dissertation:

**Non-smooth Lorentzian geometry and causality
theory**

Abstract:

The classical way of understanding general relativity is to understand smooth Lorentzian geometry. However, this implies that the extension of methods and notions to (global) non-smooth settings can be demanding tasks. Nevertheless, non-smooth spacetimes (for example impulsive waves) are physically relevant. In this talk we transfer some concepts of Lorentzian geometry to the setting of Lorentzian manifolds with metric $g \in \mathcal{C}^{1,1}$ and lower regularity. Our first aim is to analyze the causal structure of a Lorentzian manifold M with continuous metric and give requirements such that the future/past lightcone of every point $p \in M$ is open. We discover that this question is closely related to the regularity of the curves which we consider. This leads to the introduction of a calculus of variations in generalized smooth functions. We conclude our study by investigating geodesics in nonexpanding impulsive gravitational waves in spaces of constant curvature.

Prüfungssenat:

Univ.-Prof. Dr. Josef Hofbauer (Vorsitz)
(Universität Wien)

ao. Univ.-Prof. Mag. Mag. Dr. Michael Kunzinger
(Universität Wien)

Univ.-Prof. Dipl.-Ing. Dr. Gerald Teschl
(Universität Wien)

Prof. Dr. James Grant
(University of Surrey)

Zeit: Freitag, 21. Oktober 2016, 10:15 Uhr

Ort: Fakultät für Mathematik, Besprechungsraum 03. Stock, Oskar-Morgenstern-Platz 1
